

ECE 320: Handout #2

Complex Numbers and Phasors

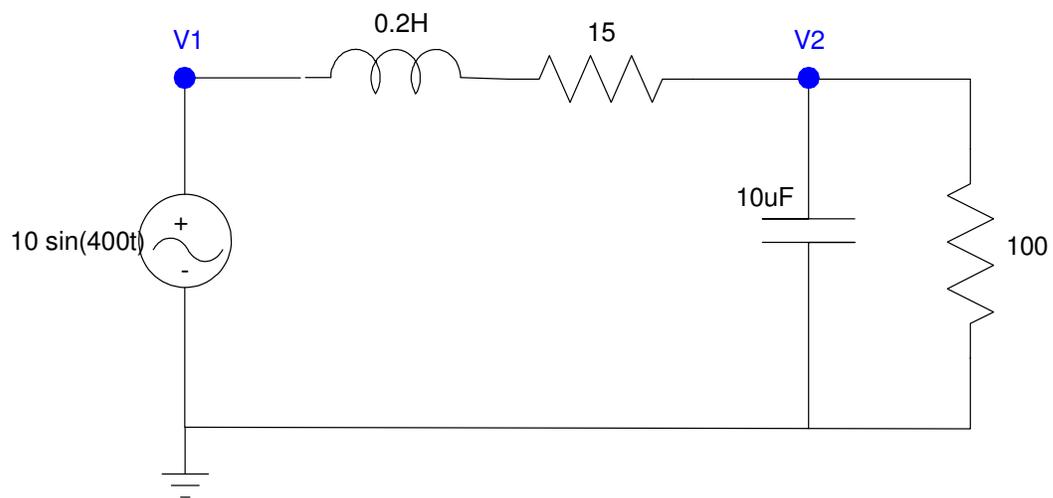

1) Find the frequency of V1 and express V1 in phasor form

2) Determine Z_{ab}

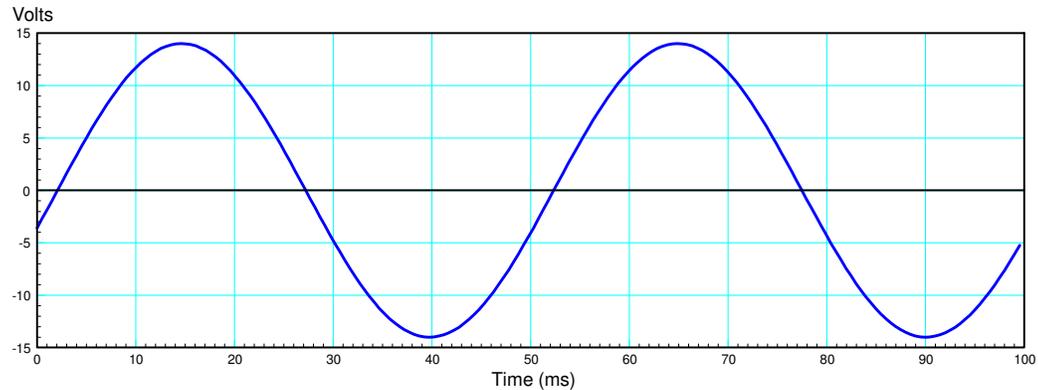

3) Find $V_2(t)$

Solutions:

1) Find the frequency of V1 and express V1 in phasor form

The frequency is 1 / period

Period = 50ms

$$f = \frac{1}{T} = \frac{1}{50ms} = 20.00Hz$$

The amplitude is about 14V

cos(t) is a maximum at t = 0.

This is a maximum at t = 15ms

The delay (phase shift) is

$$\theta = -\left(\frac{\text{delay}}{\text{period}}\right) 360^\circ$$

$$\theta = -\left(\frac{15ms}{50ms}\right) 360^\circ = -108^\circ$$

The phasor form for V1 is

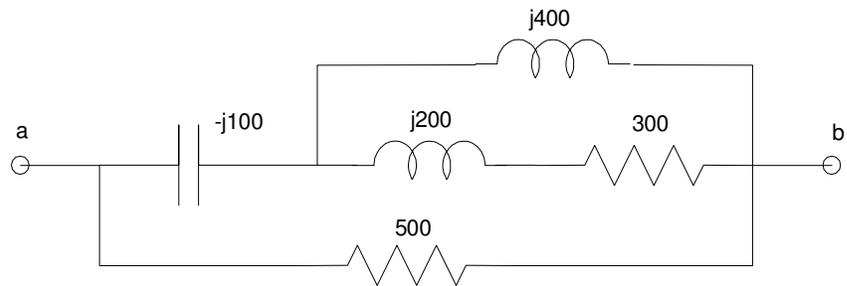

$$V_1 = 14 \angle -108^\circ$$

or

$$V_1 = -4.326 - j13.315$$

Either answer is correct

2) Determine Z_{ab}

$$(300) + (j200) = 300 + j200$$

$$(300 + j200) \parallel (j400) = 106.667 + j186.667$$

$$(106.667 + j186.667) + (0 - j100) = 106.667 + j86.667$$

$$(106.667 + j86.667) \parallel 500 = 96.154 + j57.692$$

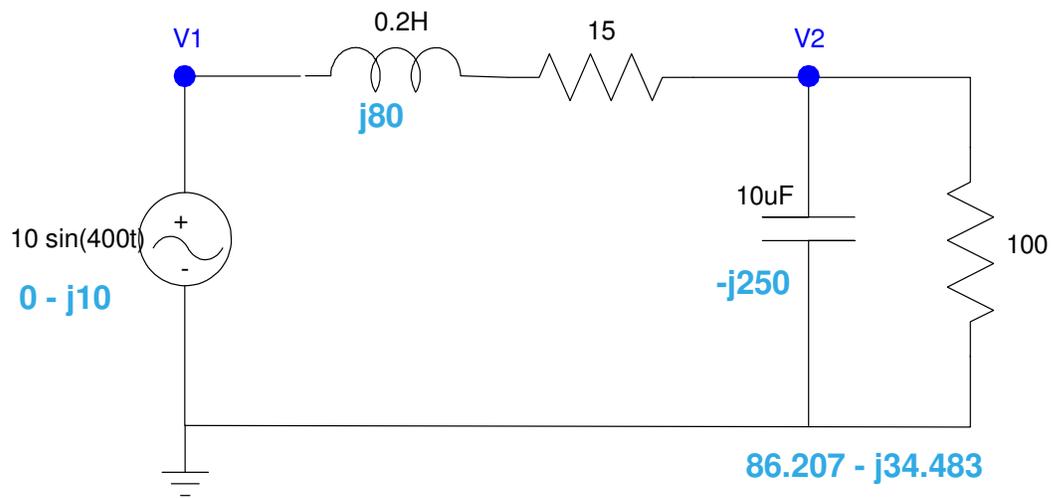

Free42 commands

```

1/x      add 500 in parallel

```

3) Find $V_2(t)$

Convert to phasors

$$\omega = 400$$

$$L \rightarrow j\omega L = j80$$

$$C \rightarrow \frac{1}{j\omega C} = -j250$$

$$V \rightarrow 0 - j10$$

Add the 100 Ohm and $-j250$ Ohms in parallel

$$Z = \left(\frac{1}{100} + \frac{1}{-j250} \right)^{-1} = 86.207 - j34.483$$

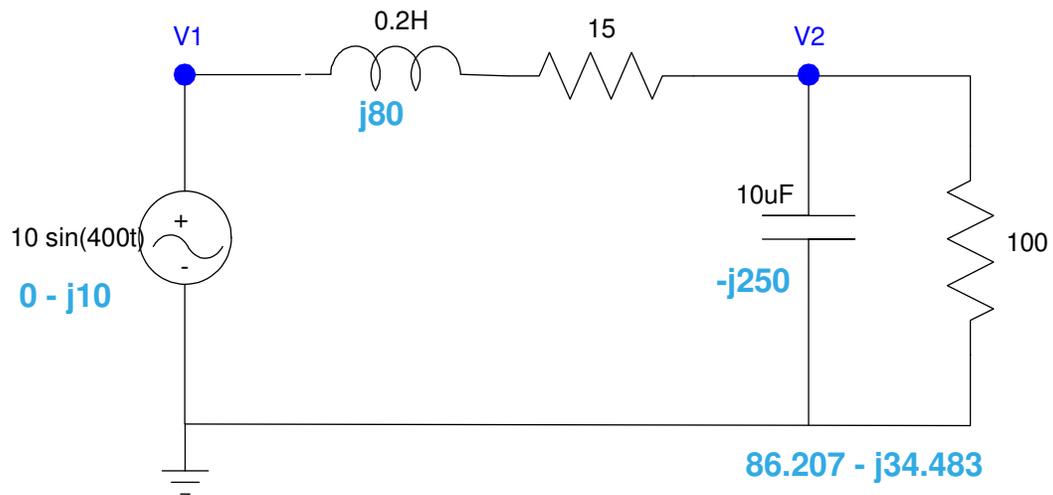

Use voltage division

$$V_2 = \left(\frac{86.207 - j34.483}{(86.207 - j34.483) + (15 + j80)} \right) (0 - j10)$$

$$V_2 = -6.020 - j5.810$$

$$v_2(t) = -6.020 \cos(400t) + 5.810 \sin(400t)$$

Free42 Commands

Free42 commands to find V2
