
Syllabus and Introduction

ECE 341: Random Processes

North Dakota State University

Instructor: Jacob Glower

note: All lecture notes, homework sets, and solutions are posted on www.BisonAcademy.com

ECE 341: Random Processes

Instructor: Jacob Glower

Office Location: at home...

Office Phone: none at present

Class Hours: noon-2:30pm Monday - Friday (also on zoom)

Office Hours: 7-8pm on Zoom

Lectures: YouTube videos

Text: Posted on Bison Academy

Grading

- Midterms: 1 unit each
- Homework & Quizzes 1 unit
- Total: Average of all above

Final Percentage:

- 100% - 90% A
- 89% - 80% B
- 79% - 70% C
- 69% - 60% D
- < 59% E

Grading will be on a straight scale to encourage working together

- Just not on tests (please)
-

Homework: Homework is graded as

- 80%: You attempted the problem with an organized approach I can follow.
- 20%: You got the right answer.

Homework is due on a daily basis. Solutions will be posted and we'll go over the homework the following day.

Testing:

- Tests will be posted at 8am, due 7am the following day.
 - 2 hour time limit from when you start
 - Each test will be different (each student generates random numbers for the test)
 - All tests are open-book, open notes, calculators, Matlab all permitted
 - Just not other people.
 - Providing or receiving help from others prohibited
 - Posting test on-line and/or using an on-line solution prohibited
-

What is a random process?

- A repeatable event
- The outcome changes each time

Not a Random Process

Can I write a program to play poker?

- Either yes or no

Did it rain last April?

- past event: yes or no

Will the Vikings beat the Packers?

- not a repeatable event

Random Process

How long will it take me to write a program similar to playing poker?

- varies: 10 to 1000 minutes

How much will it rain in April?

- varies each year
-

Matlab Review

Matlab can be treated like a calculator that works with matrices

```
[      start of matrix
]      end of matrix
,      next column
;      next row

+      addition
-      subtraction
*      multiplication
/      division

inv(A) matrix inverse
```

```
Command Window
>> A = [1,2,3]

A =

     1     2     3

>> B = [4,5 ; 6,7 ; 8,9]

B =

     4     5
     6     7
     8     9

>> C = A*B

C =

    40    46

fx >>
```

Flow Control

For-Loop

```
for i=1:10
    t = t + dt;
end
```

While-Loop

```
time = 0;
while(time < 10)
    x = x + dx*dt;
    t = t + dt;
end
```

If

```
if(time < 10)
    x = 0;
end
```

If-Else

```
if(x>y)
    points = points + 1;
elseif(x == y)
    points = points + 0.5;
else
    points = points + 0;
end
```

Command Window

```
>> X = zeros(1,4);
>> for i=1:4
        X(i) = i*i;
    end
>> X

X =

     1     4     9    16

>> x = 10;
>> dx = 0;
>> t = 0;
>> dt = 0.01;
>> while(x>0)
        ddx = -9.8;
        dx = dx + ddx*dt;
        x = x + dx*dt;
        t = t + dt;
    end
>> t

t =

    1.4300
```

fx

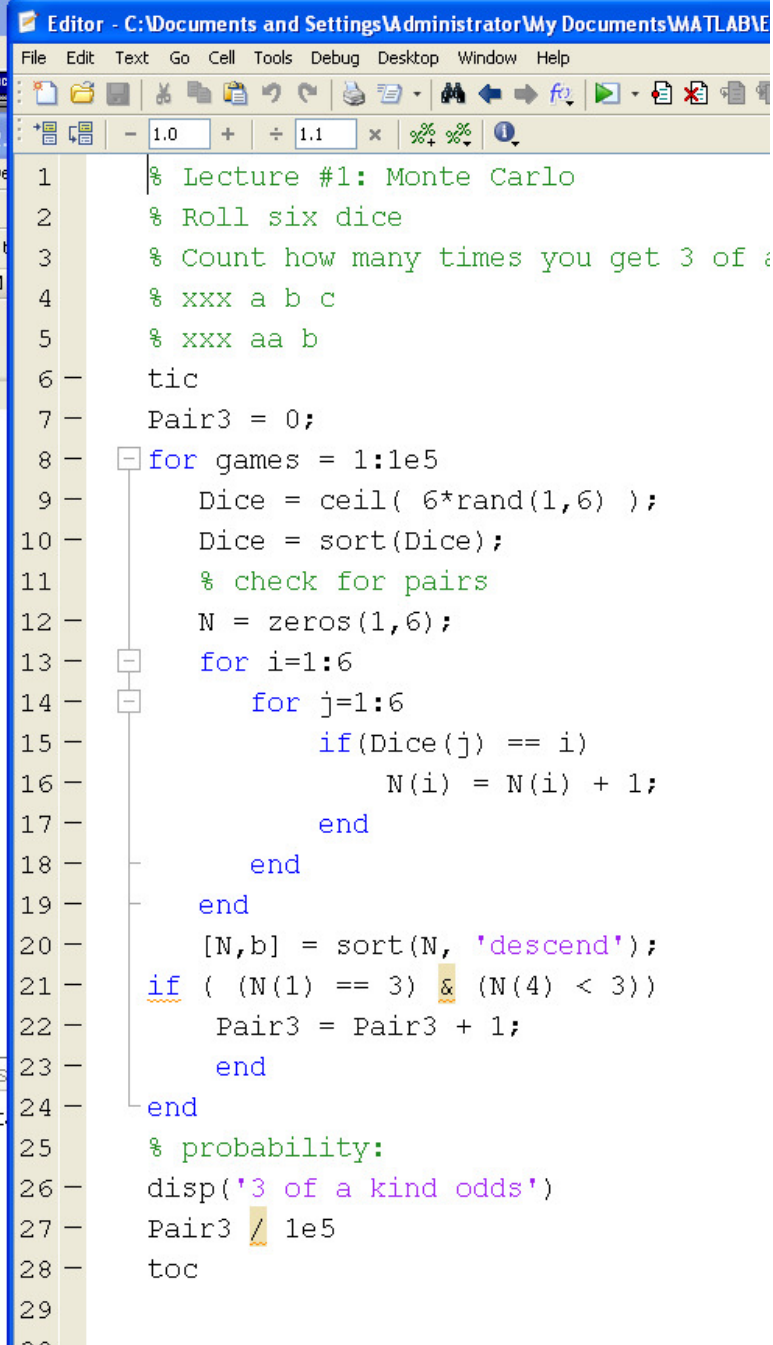

Matlab Scripts

If you're going to run the same code over and over, you can place it in a script.

Each time you execute the script, it's like pasting that code into the command window.

note: This is a convenient way to build a more complex program.

- Display the data when writing the program to see what is happening
- You can fix errors along the way

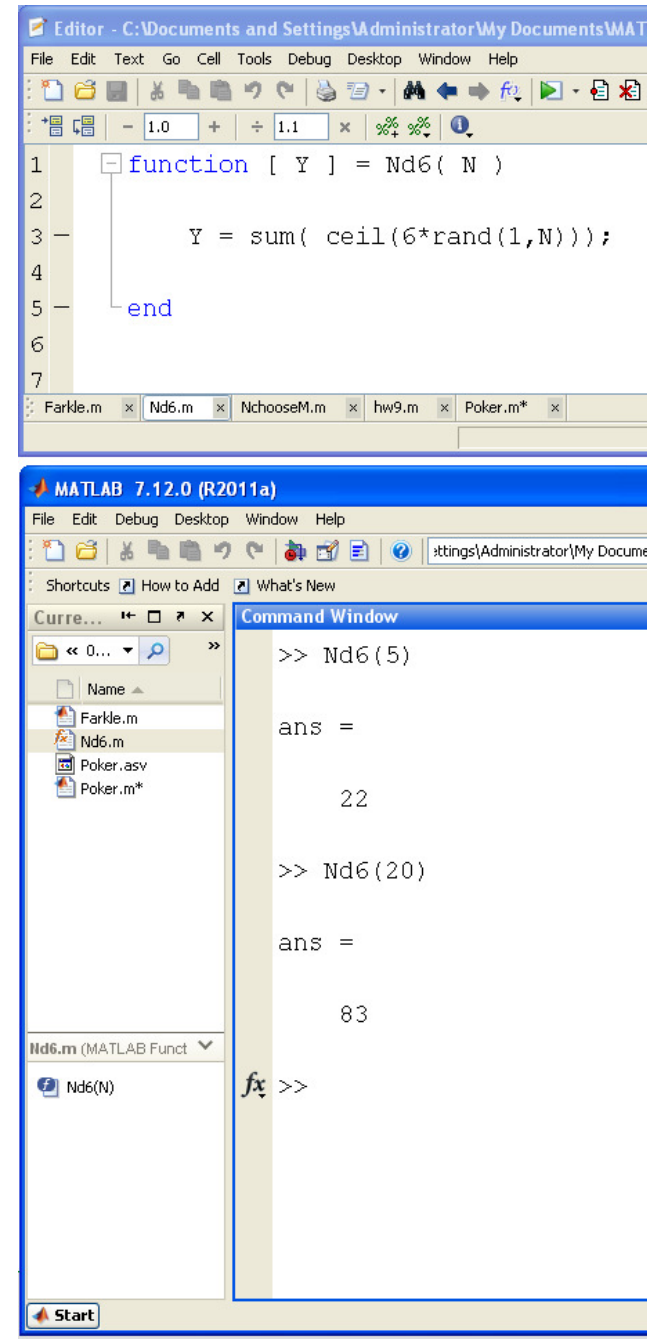

```
Editor - C:\Documents and Settings\Administrator\My Documents\MATLABE

Matlab Functions

Part of what makes Matlab so powerful is you can create your own functions

- These functions become Matlab commands that other functions can use.
- As companies build up their library of Matlab functions, they get better and better at designing their product.
- The Matlab functions become company proprietary information (design secrets).

The image shows two windows from the MATLAB 7.12.0 (R2011a) environment. The top window is an editor showing a function definition for `Nd6(N)`. The code is as follows:

```
1 function [ Y ] = Nd6( N )
2
3     Y = sum( ceil(6*rand(1,N)));
4
5 end
```

The bottom window is the MATLAB Command Window, showing the execution of the function. The first call is `>> Nd6(5)`, which returns `ans = 22`. The second call is `>> Nd6(20)`, which returns `ans = 83`. The Command Window also shows the function signature `Nd6(N)` and a cursor at the prompt `>>`.

Random Numbers in Matlab

- `rand(4,1)`: generate a 4x1 matrix of random numbers in the range of (0,1)
- `randn(4,1)` generate a 2x3 matrix of normally distributed random numbers
- `ceil(6 * rand(4,1))`: generate four 6-sided dice (4d6)

```
Command Window
>> rand(4,1)

ans =

    0.1712
    0.7060
    0.0318
    0.2769

>> randn(4,1)

ans =

   -0.8095
   -2.9443
    1.4384
    0.3252

>> ceil(6 * rand(4,1))

ans =

     2
     6
     1
     3

fx >> |
```

Problem:

- How would you mathematically describe the rand() function in MATLAB?
- How would you mathematically describe any random process?

Monte Carlo simulation

- Take a large number of samples
- As the sample size go to infinity, you fully describe the random process.
- Ex: take 1000 samples:

```
X = rand(1000,1);  
Die = ceil( 6 * rand(1000,1) );
```

List 1000 numbers isn't very useful. Instead, lets plot the data:

Again, this doesn't tell you much.

Sort the data and plot (cumulative distribution function or cdf):

```
Xs = sort(X);  
p = [1:length(Xs)]' / length(Xs);  
plot(Xs, p)  
xlabel('Y');  
ylabel('Probability X < Y')
```

Discrete CDF (dice)

```
d6 = ceil( 6*rand(100,1) );  
d6 = sort(d6);  
p = [1:length(d6)]' / length(d6);  
plot(d6, p)xlabel('X');  
ylabel('Probability Die < X');
```

Cumulative Distribution Function

$$f(x) = p(y < x)$$

Note that for a CDF,

- It starts at zero (the probability that the result is less than minus-infinity is zero. It has to be something.)
- It goes to one (the probability that some number results is one.)

Probability Density Function (pdf)

- Derivative of cdf
- Probability that x has a certain value

Example: `rand` is a uniform distribution over the interval $(0, 1)$

Probability Density Function for a uniform distribution

Discrete pdf:

Probability Density Function for a 6-sided die

This is the first concept to get across in this class:

- pdf describes the probability distribution
- cdf also describes the probability distribution

We'll look at some standard distributions:

- Bernoulli Trial: Flip a coin
 - Binomial Distribution: Flip N coins
 - Geometric Distribution:
Flip a coin until you get a heads
 - Pascal Distribution: Flip a coin until you get N heads
 - Hyper Geometric: Geometric without replacement
 - Poisson: Number of events in a time interval
 - Normal (Gaussian) Binomial distribution where N goes to infinity
-

Mean, Standard Deviation, Moments

Problem: Describe a probability distribution with a number

A second concept to get across is that simply giving the mean of a random process doesn't tell you much. You need more information.

- pdf or cdf preferred
- Mean (average) and standard deviation (spread) OK
- Moment Generating Function (LaPlace transform or z-transform)
 - $m_0 = 1$ 0th moment (total probability must be 1)
 - $m_1 = \text{average}(X)$ 1st moment
 - $m_2 = \text{average}(X^2)$ 2nd moment
 - etc.

Third, suppose you have a random process and you'd like to test a hypothesis, such as

- Does Y have a mean that's greater than X ?
- Is X a uniform distribution?

The first question results in comparing the means of the samples with the spread (standard deviation) taken in to account. This is a t-test.

The second question results in comparing the sample PDF or CDF's and results in a chi-squared distribution.

Fun with Monte-Carlo Simulations

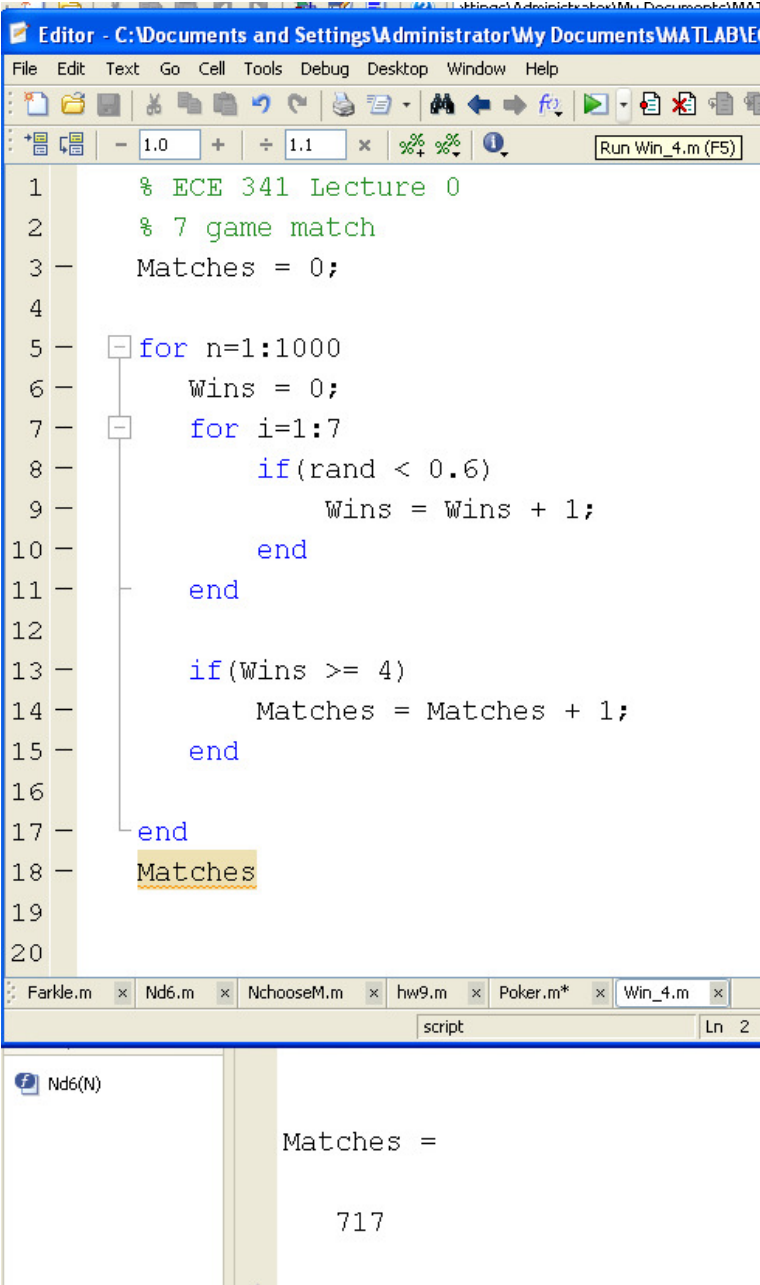

Problem: Two teams playing a match

- Team A has 60% chance of winning any given game
- The first team to win 4 games wins the match (best of 7 series)

What is the probability that team A wins the match?

Solution

- Play a single match (lines 6..14)
- Note this is a for-loop
- Then repeat 1000 times
- Team A has a 71.7% chance of winning

```
1 % ECE 341 Lecture 0
2 % 7 game match
3 Matches = 0;
4
5 for n=1:1000
6     Wins = 0;
7     for i=1:7
8         if(rand < 0.6)
9             Wins = Wins + 1;
10        end
11    end
12
13    if(Wins >= 4)
14        Matches = Matches + 1;
15    end
16
17 end
18 Matches
```

Matches =

717

Fun with Monte Carlo Simulations: Farkle Odds

Problem: Roll 6 dice.

- What is the probability of getting 3 of a kind?
- (xxx a b c) or (xxx aa b)

Monte-Carlo Simulation

- Roll 6 dice 10,000 times
- Count how many times you get 3 of a kind

Sort of the definition of probability

- Repeatable event (roll 6 dice)

Code: Farkle.txt

- Roll 6 dice (line 8)
- Count the frequency of each number
 - lines 11-18
- Sort in descending order
 - line 19
- Check if the result was a 3 of a kind
 - xxx a b c
 - 333 1 1 1
 - xxx aa b
 - 333 22 1

```
1 % Lecture #1: Monte Carlo
2 % Roll six dice
3 % Count how many times you get 3 of a kind
4 % xxx a b c
5 % xxx aa b
6 Pair3 = 0;
7 for games = 1:1e4
8     Dice = ceil( 6*rand(1,6) );
9     Dice = sort(Dice);
10    % check for pairs
11    N = zeros(1,6);
12    for i=1:6
13        for j=1:6
14            if(Dice(j) == i)
15                N(i) = N(i) + 1;
16            end
17        end
18    end
19    [N,b] = sort(N, 'descend');
20    if ( (N(1) == 3) & (N(4) < 3) )
21        Pair3 = Pair3 + 1;
22    end
23 end
24 % probability:
25 disp('3 of a kind odds')
26 Pair3 / 1e4
27
```

Result: 100,000 rolls

- Each time you run the code you get a different result
- It's random
- Probability is about 31.6% chance

You can determine the 90% confidence interval for the probability

- t-test
- coming soon

Command Window

Monte Carlo Simulations: Poker Odds

Determine the odds of drawing 3 of a kind in poker

- 52 card deck
- Draw 5 cards
- Results is 3 of a kind
 - xxx y z
 - x, y, z are different values (Ace to King)

Wikipedia: $p = 0.02113$

Verify using Monte-Carlo techniques

Matlab Code

Shuffle the deck

- Line 8 - 9

Draw 5 cards

- Line 10:
- Draw the top 5 cards

Determine suit & value

- Line 11-12:

Count frequency of A..K

- Line 14-17

Success = 3 of a kind

- Line 21:
- $N = [3, 1, 1, 0, 0, \dots]$

```
1 % lecture 1: Monte Carlo 5-Card Stud
2 % Probability of 3 of a kind
3 tic
4 Pair3 = 0;
5
6 for i0 = 1:1e5
7
8     X = rand(1,52);
9     [a,Deck] = sort(X);
10    Hand = Deck(1:5);
11    Value = mod(Hand,13) + 1;
12    Suit = floor(Hand/13) + 1;
13
14    N = zeros(1,13);
15    for n=1:13
16        N(n) = sum(Value == n);
17    end
18
19    [N,a] = sort(N, 'descend');
20
21    if ((N(1) == 3)*(N(2) < 2)) Pair3 = Pair3 + 1; end
22
23 end
24
25 [Pair3]
26 toc
```

Poker Results: 100,000 hands

- Results vary each time you run the code
 - It's a random process
- About 2111 successes each 100,000 hands
- $p(x) = 0.02111$ ish

From Wikipedia:

- $p(x) = 0.02113$

```
Command Window

Pair3 =

    2111

Elapsed time is 10.900704 seconds.

Pair3 =

    2109

Elapsed time is 10.724140 seconds.

Pair3 =

    2113

Elapsed time is 10.952154 seconds.
fx >> |
```

Summary

A random process is

- Repeatable
- The results are different each time

Probability is

- The ratio (success / trials)
- As the number of trials goes to infinity

Monte-Carlo simulations can approximate this

- Results will vary each time you run the simulation
 - Gets more accurate as the number of trials goes to infinity
-
